Documentation 🗵 Developer Resources 💌 Connect REST API 💌 REST API Clients 💌

Postman

This article has been generated from the online version of the documentation and might be out of date. Please, make sure to always refer to the online version of the documentation for the up-to-date information.

Auto-generated at August 20, 2025

×

Postman is a collaboration platform for API development. Postman's features simplify each step of building an API and streamline collaboration so you can create better APIs. Download the Postman REST API client from **www.postman.com**.

This article describes how to successfully import API specification to Postman and how to start working with the Connect API.

Prerequisites

Before starting to work with the Postman client, make sure that all prerequisites are met.

Namely, it is required to create a Custom token, assign required permissions and copy your API Key/Handle value.

Furthermore, make sure that Postman uses correct API endpoint for making calls.

API Specification Import

First, get familiar with the API specification and download the required file via our Open API specification page.

After that, open the Postman client and import API specification as described below:

						_		~

Connect REST API provides you with the lowest-level access to the functionality of the Connect Platform. All other integration methods, like our Portals, SDKs and Extensions are built on top of the REST API layer.
History		5	Key Authorization Value <api key=""></api>							Please visit our Community Portal for more information A This file was generated on Wed Feb 2 08:01:26 5 (UTC) and may not be updated. Please download the latest version at https://apispec.connect.cloudblue.com/connect- openspi30.yml.
			Add to Header			~				Authorization API Key Key <key> Value <value></value></key>

- 1. Access your workspace and click the **Import** button.
- 2. Click the Upload Files button and select your downloaded API specification file
- 3. Once your file is uploaded, click the **Import** button to confirm this operation.

Therefore, the API specification will be successfully imported to Postman. Note that it is also required to paste your *API Key/Handle* and *API endpoint* to your generated collection by following the steps below.

Collection Configuration

Once the API specification is added successfully, access the *Authorization* and *Variables* options by clicking on your collection from your Postman workspace.

Authorization Settings

First of all, proceed to the **Authorization** tab and configure the authorization method as follows:

- **Type**: Select *API Key* in this field.
- **Key**: Choose Authorization.
- Value: Paste your API Key/ Handle value that is copied from the CloudBlue Connect platform
- Add to: Select Header.

Click the **Save** button to save your authorization method configuration.

Variables Settings

Switch to the **Variables** tab and make sure that the following variable and required values are configured correctly:

S My Work	kspace	New Import	← GET	GET	UCI	Over	GET U	□ □ C. ●	-	> +	000	NO ERVI				~

• Variable: The table should have a variable that is called *baseUrl*.

×

- **Initial value**: Shared with your team when you share your variable in a collection, environment and globals. This value may represent your copied *API endpoint*.
- **Current value**: Used while sending a request and never synced with Postman servers. If this value is empty, the client automatically uses the initial value (may also contain your *API endpoint*).

Click the **Save** button to save your changes. Thus, you can test out your configuration and start working the Connect API via the Postman client.

Make a Sample Call

×

Test your configuration and ensure the Postman client works correctly by making a sample call.

For example, access the agreement section from your added collection and open the *GET*: *dp* Agreements- list Agreements call to access a list of your agreements objects on the CloudBlue Connect platform:
