Multi-Factor Authentication (MFA)

This article has been generated from the online version of the documentation and might be out of date. Please, make sure to always refer to the online version of the documentation for the up-to-date information.

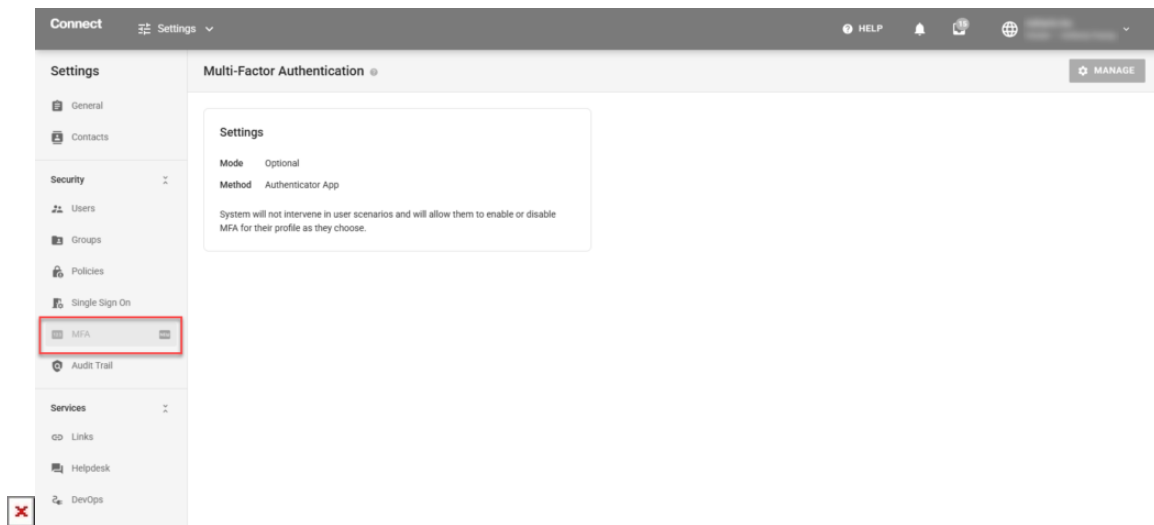

Auto-generated at December 18, 2025

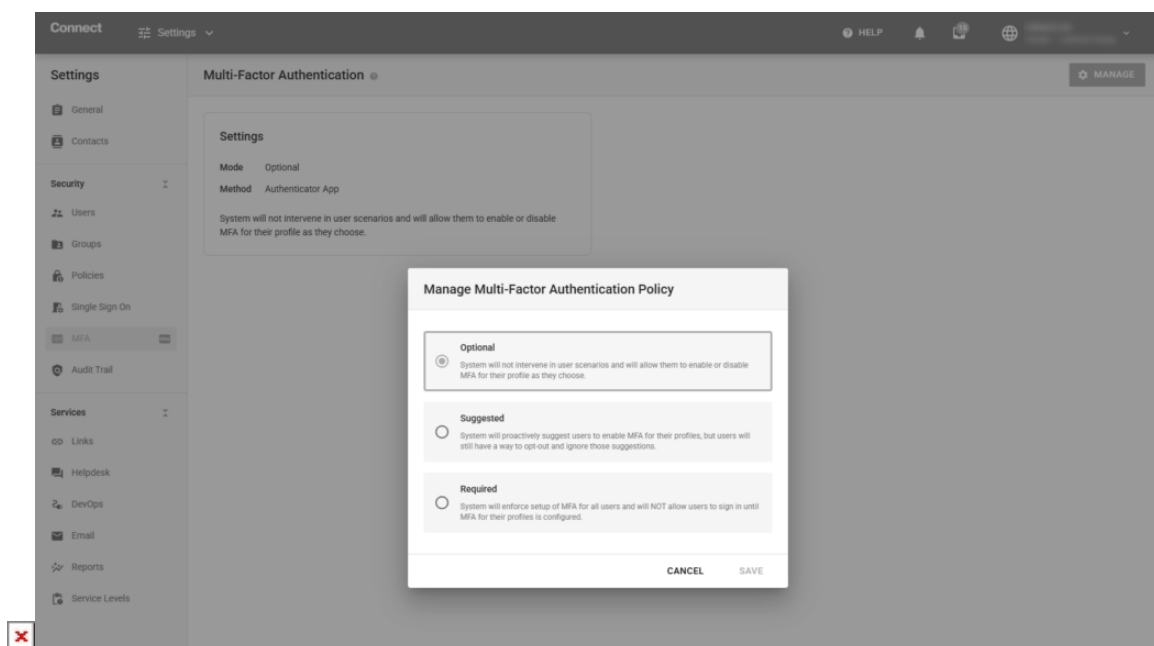

The **Multi-Factor Authentication (MFA)** section of the Account module is used by administrators of the account to set up multi-factor authentication for users when accessing the partner account. The following describes the MFA section user interface and provides instructions on how to enable different modes when configuring MFA settings within the account.

Multi-Factor Authentication

When navigating to the MFA setting, the **Settings** view provides administrators different options with regards to using MFA within the partner account.

Administrators can click **Manage** and is present with three different options for managing the account's multi-factor authentication policy

Administrators can then select the desired policy that will be applied on the account.

Caution

If the account is set up with a **Single Sign On** integration with the partner's own Active Directory, the Active Directory's settings and procedures will take precedence and override any Connect platform MFA settings.

Individual users of the account can go into their **User Profile** section to set up their individual multi-factor authentication into the platform.
